                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             11-JUL-2002.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ABZ30969;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 1523
```

```
The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are medified. The diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a gene product, preferably enzymatic activity, carbon cativity of a gene product, preferably enzymatic activity, carbon transluction, preferably enzymatic activity, carbon cativity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of c. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR continuation is not represented in the printed sequence is that of a presented in the printed superinted superinted for the printed for a presented in the method of the invention. Note: The sequence data for this patent is not represented in the printed sequence is that of a presented in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosynthetic, transporter, transcriptional, cranslational, signal transduction, DNA repplication and cell division activity. The method is useful for identifying a compound having the contrainty of inhibit growth or proliferation of c. albicans cells and contrainty of a perent is not repersented in the printed specification but is based to contrain the printed specification but is based this patent is not represented in the printed specification but is besent of contraints.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       o;
                                                                                                                                                                                                                                                                                                                                                                                                                                                      is patent is not represented in the printed specification but is based sequence information supplied to Derwent by the European Patent Office

polypeptide which regulates, causes or contributes to obesity in an animal or a human. The polymolectides, proteins, ant-adp antibodies, modulators of adp activity, adp antisense nucleic acids, expression vectors, adp transgenic animals are useful in the diagnosts and treatment of obesity, adipositas, bulimia, wasting (cachexia), eating disorders and/or disorders of body weight/body mass, weight loss due to cancer or infectious diseases, genetic disorders associated with hypogonadism e.g. prader-Willi syndrome, Laurence-Moon-Biedl syndrome, hypothyroidism, cliseases, inflammatory bowel disease, uncerative colitis, and anorexia nervosa. They are also useful for treating disorders of body weight/mass treating lipomas, and/or liposarcomas. The compositions are also useful for treating disorders of body weight/mass treating lipomas, and/or liposarcomas. The compositions are also useful for treating conditions associated with under weight e.g. enhancing or

                                                                                                                                                                   The present invention relates to novel antisense oligonucleotides which are targetted to nucleic acids encoding human raf proteins and capable of inhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is human raf kinase related antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents a mouse syndecan-1 reverse transcription PCR primer. The invention relates to a novel use of a Smad3 inhibitor in preparing a medicament to treat or prevent wounds or fibrosis. The invention has antifibrotic and vulnerary activity. The Smad3 inhibitors are useful for preventing fibrosis and improving wound healing. The Smad3 protein, polypeptides and peptide fragments are useful for generating antibodies, as reagents for research purposes, or the identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         preventing wounds or fibrosis, or as reagents in assays for screening compounds for preventing fibrosis and improving of wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The compound of the invention has antiinflammatory, cytostatic, and anti-infective activity. The antisense compounds may have a use in antisense gene therapy. The antisense compounds are useful for treating or preventing disorders associated with expression of human CTI, e.g. infections, inflammation and tumours, and
other cellular gene products involved in the regulation of fibrosis and improvement of wound healing, as reagents in assays for screening for compounds that can be used in the prevention of fibrosis and improvement of wound healing, and as pharmaceutical reagents in protecting against fibrosis and improving wound healing related to Smad3. Compounds that fibrosis and improving mound healing related to Smad3. Compounds that mutant Smad3 gene products, in inhibiting the activity of wild type and/or mutant Smad3 gene products, in elaborating the biological function of smad3, and in identifying compounds that disrupt normal Smad3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    as research and diagnostic reagents. Sequences ABQ66412-ABQ66511 represent chimeric phosphorothicate oligonucleotides, with 2'-MOB wings and a deoxy gap. The claimed sequences inhibit production of cytohesin-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytonesin-1; CT1; inhibit; cytostatic; antiinflammatory; cytostatic;

oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigatus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAI gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oligonucleotide probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   particular sites and identifying if ligation of the oligonucleotide probe
sets occurred and correlating (using a computer) identified ligation to a
presence or absence of the target nucleotide sequences. ABI82074 to

oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fundgautus, viruses e.g. T-cell lywphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamobal histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAH gene, p53 gene, human papillomavinus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                      Human, K-ras, PCR primer, probe, capture probe, mutation detection,

congretes Alloysons represent proportion considers and seek designed to target different regions of human talin RNA, and were analysed for their effect on talin expression. The antisense were calculated to target different regions of human talin RNA, and were analysed for their effect on talin expression. The and were calculated by the control of their editions of their editions of the calculation of callular and vinculin to integrins, thereby linking the regulation of callular and may play a role in platelet adhesion as its subcellular distribution differs between resting non-adhesive platelets subcellular distribution differs between resting non-adhesive platelets. The contractile force to the extracellular and activated adhesive platelets. It could also play a major role in determining muscle strength and cardiac function as it has been found to participate in the transmission of contractile force to the extracellular expression at myotendinous junctions. The expression of talin is downregulated by androgens in prostate tissues, a phenomenon known to contribute to the development of prostate cancer. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of talin the related disorders, such as those related to cellular adjection. The contraction and treatment of talin and the contraction and contraction and calculation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides targeted to nucleic acid molecules encoding human Talin, useful for inhibiting the expression of human Talin and for treating a human having a disease or condition associated with
                                                                                                                                                                                                                                                                                                                                                                                           /note= "This oligonucleotide has a phosphorothioate backbone and 2-"methyoxyethyl (2-'MOS) wings at the 5' and 3' ends, which are 5 nucleotides in length. Also all cytosine nucleotides are 5-methylcytosines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present sequence represents a human c-Ha-ras phosphorothioate antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             coupled receptor (GPCR) proteins. The GPCR sequences have antidiarrheic and laxative activities. The GPCR sequences can be used for developing drugs to treat diseases of the digestive organs, e.g. colitis, diarrhea, constipation and malabsorption syndrome, including gene diagnosis and therapy. The present sequence represents a PCR primer for rat GPCR, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human and rat brain-originated G protein-coupled receptor proteins and encoded DNAs, for developing drugs to treat diseases of the digestive organs, e.g. colitis, diarrhea, constipation and mal-absorption syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present invention describes human and rat brain-originated G protein-

Human; mouse; ss; primer; gene 216; antiasthmatic; antiinflammatory; anorectic; chromosome 20pil-pl2; single nucleotide polymorphism; SNP; gene therapy; respiratory disease; asthma; obesity; PCR; bronchial hyper-responsiveness; chronic obstructive pulmonary disease; adult respiratory distress syndrome; inflammatory bowel syndrome.

Human gene 216 polymorphism detection PCR primer #32.

(first entry)

25-MAR-2003

```
(ATP) binding cassette transporter gene subfamily C12, i.e. cystic bibrosis transmembrane conductance regulator/multidrug resistance-like subgroup (CFTR/MRP) family) polypeptide and its encoding polymucleotides The polypeptide is useful for screening agonists and antagonist of the ABCC12 polypeptide. The products of the invention are useful for screening an active ingredient for preventing and treating paraxysmal kinesigenic chorecathetosis or parhologies linked to dysfunction of transport of organic anion transporters such as cysteinyl leukotriene, anionic drugs, such as methotrexate, neutral drugs conjugated to acidic ligands, such as glutathione, glucuronate or sulphate conjugated drugs and can be used for somatic gene therapy. This sequence represents a region corresponding to an exon/intron boundary from the gene encoding a human ABCC12 isoform described in the disclosure of the invention
                                                                                                                                                                                         Adenosine triphosphate (ATP)-binding cassette transporter subfamily Cl cystic fibrosis transmembrane conductance regulator; human; CFTR/MRP; multidrug resistance-like subgroup; somatic gene therapy; ABCCL2; paroxysmal kinesigenic choreoathetosis; cysteinyl leukotriene; anionic drug; methotrexate; neutral drug; glutathione; glucuronate; sulphate conjugated drug; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New ATP-binding cassette transporter gene subfamily C12, ABCC12 polypeptide, useful for preventing or treating paroxysmal kinesigenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel human ABCC12 (adenosine triphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Arnould-Reguigne I, Denefle P,

This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nucleotide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiasthmatic, antinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are useful for diagnosing, preventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease or adult respiratory distress syndrome), obseity, or inflammatory bowel syndrome. The nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleic acids can also be used as primers and templates for the recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene 216 specific PCR primer used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGP) receptor 3 (also known as FGPR-3) ACH, TYR4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                               /mod_base= OTHER /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated gene 216 nucleic acids, useful for diagnosing, preventing or treating a disorder, such as asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease, obesity or inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single mucleotide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiasthmatic, antinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are useful for diagnosing, preventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleic acids can also be used as primers and templates for the recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence represents a gene 216 specific PCR primer used in the
                                               Human; mouse; ss; primer; gene 216; antiasthmatic; antinflammatory; anorectic; chromosome 20p13-p12; single nucleotide polymorphism; SNP; gene therapy; respiratory disease; asthma; obesity; PCR; bronchial hyper-responsiveness; chronic obstructive pullmonary disease; adult respiratory distress syndrome; inflammatory bowel syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     disease or adult respiratory distress syndrome), obesity, or inflammat
bowel syndrome. The nucleic acids are also useful for identifying
increased susceptibility of a subject to the disorders mentioned. The

The present sequence is that of an antisense primer for Fas-associated ACR05705 generates a 695 bp product. Semi-quantitative RT-PCR was used to determine levels of FADD RNA in thyroids of gep transgenic mice during various stages of tumour development. These mice provide models of buman thyroid tumours. RADD expression was shown to decrease, in some cases to zero, during tumour development. It therefore provides a marker for the absence of in vivo tumour. FADD proteins are secreted from tumour cells. A low cellular amount and a high extracellular amount of FADD proteins are prognostic of resistance to chmotherapy. The invention provides methods for determining a status of tumour absence/presence, and for prognosis of the resistance of a tumour to chemotherapy on the basis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method and a kit for determining the expression of mRNA or CDNA of a protein participating in the maintenance of skin structure. The method is quantitative, simple and accurate in the determination of extracellular matrix components of laminin 5 chain genes LAMA3, LAMB3 and LAMC2, matrix metalloproteinases MMP-1, MMP-2, MMP-3 and MMP-9, VII collagen, type I collagen alpha 1 chain, type IV collagen alpha 2 chain, type IV collagen alpha 2 chain, TIMP-1, TIMP-2 and TIMP-3. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                              disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczem, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                The invention describes a method of treating non-allergic inflammatory
                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                     ;

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding complement component C3. The compound peculically whybridises with the nucleic acid molecule encoding complement component C3 and inhibite the expression of complement component C3, or specifically hybridises with at least an 8-nucleobase component C3, an active site on a nucleic acid molecule encoding complement component C3. Also included are a composition comprising the compound and a paramaceutical carrier or diluent, inhibiting the expression of a pharmaceutical carrier or diluent, inhibiting the expression of component C3 in cells or tissues (comprising contacting the compound cited above) and treating an animal having a disease or condition associated with complement component C3 comprising administering to the animal the compound cited above so that expression of complement component C3 is inhibited. The antisense compounds are useful for inhibiting the expression of complement c3 in cells or tissues, or for treating an animal having a

autoimmune disorder (e.g. multiple sclerosis), an infection, or atherosclerosis, inflammation, septic shock, multiple organ failure, hyperacute organ failure and CNS inflammation. The compounds are also useful as research reagents and diagnostics, in distinguishing functions of various members of a biological pathway, or for preventing or delaying infection, inflammation or tumour formation. The present sequence is an antisense oligonucleotide targeting mouse C3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating hypercholesterolemia or hyperproliferative disorder, e.g.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mod_base= OTHER

EFF2C1 is located on chromosome 1p34-35, and is also known as Co-eFF2C, eFF2C, Golgi ER protein 95kDa, GER995 and Q99. It is an intracellular membrane associated protein thought to be involved in cellular differentiation, such that altered expression of EFF2C1 can
disease or condition associated with complement component C3 such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antisense; ss; human; eukaryotic translation initiation factor 2C 1; EIF2C1, CO-eIF2C; eIF2C; Golgi ER protein 95kDa; GERp95; Q99; gene therapy; hyperproliferative disorder; familial hypercholesterolaemia; cancer; polycystic kidney disease; cystic fibrosis; progeriod syndrome; cytostatic; antilipaemic.

affect cell growth, morphology and tumourigenicity. Accordingly, antisense oligonucleotides that inhibit the expression of BIF2C1 in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders, familial hypercholesterolaemia and cancer, as well as polycystic kidney disease, cystic fibrosis and progeriod syndrome. As such, the oligos of the present invention can be described as having cytostatic and antilipaemic activities. This oligonucleotide sequence is an antisense oligo used to inhibit expression of the human eukaryotic translation initiation factor 2C I (BIF2C1) DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò

```

New compound having a sequence targeted to a nucleic acid encoding Transforming growth factor beta-receptor II, useful for preparing a composition for treating hyperproliferative disorder e.g., lung, liver,

Wyatt JR;

Murray SF,

WPI; 2003-175279/17.

```
The present invention describes isolated polynucleotides (I) encoding proteins (II) from Lolium perenne and Festuca arundinacea which are active in Ligain, fructan and tannin biosynthetic pathways. Also described: (I) an isolated oligonucleotide probe or primer comprising at least 10 contiguous residues complementary to 10 contiguous residues of (I); (2) a kt comprising the oligonucleotide probe or primer; (3) a genetic construct comprising (I); (4) a transgenic plant cell comprising the genetic construct of (3); (5) a plant or its seed, fruit or progeny comprising the transgenic plant cell of (4); (6) modulating one or more of the lignin, fructan or tannin compositions of a plant; (7) producing a plant having one or more of the lignin, fructan or tannin compositions;
                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide encoding polypeptides from Lolium perenne or Festuca arundinacea, useful for modulating the biosynthesis of lignin, fructan or tannin in a plant.
                                                           The invention comprises antisense oligonucleotides that are targeted to the nucleic acid encoding transforming growth factor beta (TGF-beta) receptor II. The antisense oligonucleotides of the invention are useful for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. rhematoid arthritis). The present DNA sequence represents a 2'-O-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone that is targeted to human TGF-beta receptor II.
                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Glenn M;

The invention relates to a compound (antisense oligonucleotide)
hybridising with the eighth nucleobase portion of an active site on a
nucleic acid molecule encoding CD81 (also known as TAPA-1, a tetraspanin)
and inhibiting the expression of CD81. Also included is a composition
comprising the antisense oligonucleotide and a carrier or a diluent. The
antisense oligonucleotide is useful for inhibiting the expression of CD81
in cells or tissues. The antisense oligonucleotide is also useful for
treating infections preferably viral, bacterial and parasitic and
diseases such as inflammatory disorders and autoimmune disorders. The
disease or condition is characterised by chemical dependency (e.g.
                                                                                         inhibiting the expression of CD81, useful for treating infections and disease associated with expression of CD81 such as inflammation disorder.
                                                          Novel compound hybridizing with nucleic acid molecule encoding CD81 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The oligonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonucleotide of the invention.
                                                                                                                                   subtypes of human papilloma virus (HPV) contained in a sample. The digonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonucleotide of the invention.

The invention relates to a novel angiogenesis inhibitor comprising a compound that inhibits the activity of an amino acid sequence given in the specification. Angiogenesis-related proteins Bv8, ZAQ and ISE were utilised within the method of the invention. The molecules of the invention demonstrate cytostatic and antiinflammatory activities whilst the method may be useful for treatment and prevention of cancer, ovarian diseases, diabetic retinopathy and inflammatory disease. The current sequence is that of the angiogenesis inhibitor-related PCR primer of the

This invention describes a novel method for investigating genetic infertility or predisposition in males. The method involves selecting at least two infertility-associated mutations which are recessive or intermediate that are associated mutations which are recessive or intermediate that are associated with infertility in the heterozygous state and/or only in the homozygous state. Preferably at least one azoospermia factor is detected which may be lost by macrodaletions in intervals. Isted, present in the cystic fibrosis transmembrane conductance regulator (CTRX), Kallmann syndrome (KAL1), androgen conductance regulator (CTRX), Kallmann syndrome (KAL1), androgen conductance regulator (CTRX), Kallmann syndrome (KAL1), androgen conductancy strands, are fixed to a carrier, particularly as a microarray, then tested for hybridization with oligomucleotides from or synthesized from, a patient sample and hybridization detected. Whitifactorial analysis is by standard statistical methods, particularly the quantitative trait locus method. The method is used to diagnose inherited male infertility or predisposition to its, especially in conjunction with in vitro fertilization programs, e.g. for assessing intracycoplasmic sperm injection method. Analysis of many mutations intracycoplasmic sperm injection method. Analysis of many mutations intracycoplasmic sperm injection method. Analysis of many mutations of intracycoplasmic sperm injection method. Analysis of many mutations of intracycloides that represent known mutations (nonsense or missence, consequence analyzing genetic infertility in meles comprises of inservations, allelic variants deletions or rearrangements) in the cyclic through analyzing genetic infertility in method. Analyzing analyzing genetic analyzing genetic analyzing genetic analyzing genetic analyzing analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       fibrosis transmembrane conductance regulator, Kallmann syndrome, androgen resistance and steroid 21-hydroxylase genes. ADD42140-ADD4633 represent oligonuclectides used in the microarray described in the method of the invention. NOTE: there are no SEO ID's 133, 472 or 473 represented in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Investigating male genetic infertility, useful for diagnosis e.g. for assessing suitabilty for in vitro fertilization, based on multifactorial analysis of infertility-related mutations.

New isolated NOVX polypeptides and polynuclectides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.

Example C; SEQ ID NO 318; 447pp; English.

The invention relates to a novel isolated NOVX polypeptide. The polypeptide of the invention demonstrates, antidiabetic, anorectic, cardiant, hypotensive, antiarteriosclerotic, virucide, antibacterial, fungicide, protozoacide, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, antiinflammatcory, dermatological, antiasthmatic and antilipaemic activities. The

```
polypeptides, nucleic acid molecules and antibodies may be useful for treating or diagnosing diseases including metabolic disorders such as diabetes and obesity, infectious diseases, anorexia, cencer, cardiovascular diseases including hypertension and atherosclerosis, neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease and epilepsy, immune disorders, asthma and atherosclerosis, disease and epilepsy, immune disorders, asthma and dyslipidaemia. Furthermore, the nucleic acids and polypeptides may also be used to identify molecules that modulate or inhibit neurogenesis, cell differentiation and proliferation, haemopoiesis, wound healing and angiogenesis, as well as in gene therapy. Finally, the nucleic acids may be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the RT-PCR primer which was used within the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention.

New cytochrome P450 and NADPH oxidoreductase, i.e. CPR and CYP, genes and proteins, useful for discriminating members of a gene family by

```
The invention relates to isolated nucleic acids encoding cytochrome P450 (CYP) and NADPH reductase (CPR) enzymes of the omega-hydroxylase complex of Candida tropicalis. Also included are the CYP and CPR proteins (Comprising CPRA, CPR52A1A, CYP52A2A, CYP52A2B, CYP52A3B, CYP52A5A, CYP52A3B, CYP52A5B, CYP52A5B, CYP52A3B, CYP52A5B, CYP52A5B, CYP52A3B, CYP52A5B, CYP5A5B, CYP5A5B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
quantifying the amount of target mRNA in a sample, or for omega-oxidation of long chain fatty acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

04-MAY-2001; 2001TW-00110785.

A detecting apparatus and a detecting method for identifying the subtypes of many species of human papilloma viruses at the same time and a composition for the detection.

Claim 1; SEQ ID NO 494; 166pp; Japanese.

subtypes of human papillomaviruses (HPV) contained in a sample which comprises a carrier which can load sample, a first oligonucleotide loaded on first part of the carrier and a second oligonucleotide loaded on second part of carrier, in which first and second oligonucleotides hybridise with the DNA of the first and the second HPV subtype and can identify HPV subtype contained in sample at the same time. ADF43644-This invention describes a novel detecting apparatus for identifying the

The present invention relates to a method for judging the genotype of hepatitis B viruses (HBV) in which part of the gene sequence of the PreSl region of HBV is amplified by PCR using labelled primers and the amplified product is hybridized with HBV type A, B, C, D, B, F and G gene specific probes and the label in the PCR product is detected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    P450; NADH reductase; dicarboxylic acid production;

                                                                                                                                                The invention describes an isolated nucleic acid encoding a CYP52A2B protein comprising the fully defined sequence of 522 amino acids, as given in the specification, and comprising a coding region defined by nucleotides 1072-2640 of a fully defined sequence of 3755 base pairs, as given in the specification. The nucleic acids encoding the cytochrome P450 and NADH reductase enzymes of Candida tropicalis are useful for increasing the production of dicarboxylic acid for oxidising organic substrates such as fatty acids. This sequence represents a quantative competition reverse transcriptase PCR (QC-RT-PCR) primer for quantating the level of Candida tropicalis CYP52A5 RNA in a sample.
                                                                                                         93
                                                                                           New nucleic acids encoding a CYP52A2B protein useful for increasing th
production of dicarboxylic acid for oxidizing organic substrates such

The nucleic acid is useful for discriminating between members of a gene family by quantifying the amount of mRNA in a sample. The present sequence represents a Candida tropicalis quantitative competitive reverse transcription (QC-RT)-PCR

is complementary to a second variant nucleotide at the position, thus to require missincorporation of the first nucleotide at the position, thus to reduce missincorporation of the first nucleotide on a template comprising molecular events for identifying individuals with mutations indicative of cancer. They are particularly useful in detecting a rare mutation in a heterogeneous biological sample (e.g. sporadic mutation in a heterogeneous biological sample), detecting rare genotypes in genotyping reactions (e.g. viral genotyping reactions), or detecting mutant or viral sequences in pooled samples (e.g. detecting polymorphisms or inherited sequence variations in pooled patient samples). This polymucleotide sequence represents a primer used as part of the primer extension assay
nucleotide that is complementary to a first variant nucleotide suspected
                                                                                                                                                                                                                                                                                                                      the invention.

The invention further relates to: an oligonal containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 120 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing the single nucleotide polymorphisms in human gene. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymorleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polynucleotide useful for detecting single nucleotide polymorphisms

first active agent comprising an oligonuclectide antisense to the intitation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nacal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antistshmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisinal manarory steroid in a subject, for reducing levels of adenosine contiinflammatory steroid in a subject, for reducing levels of adenosine continuing surfactant in a subject, st issue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                    0;

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an preventing sensitivity to adenosine. reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing pronchodilation, increasing levels of ubiquinone or ung surfactent in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        unctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention as antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an inifilammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, lung autfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                       °,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating allments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                           Human, antisense; lung dysfunction, nasal airway dysfunction, antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiinflammatic; hypotensive; ortostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or antiallary dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antinflammatory antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treading or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antinflammatory sferoid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition
                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Katz E, Pabalan J, Aguilar D;

first active agent comprising an oligomortal contribution within the first active agent comprising an oligomortal contribution codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entile flammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use antiinflammatory und or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of on the inflammatory sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an anti-inflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating ailments associated with impaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or

The gene encoding human PEDF maps polymucleotide sequences encoding it. The gene encoding human PEDF maps version of PEDF referred to as PEDF-BH, vectors comprising nucleic acids encoding PEDF or PEDF-BH, and a method of using these sequences to treat retinal diseases such as retinal tumours (e.g. retinoblastoma), neuronal-retinal tumours, macular degeneration, retinitis pigmentosa, retinal detachment, diabetic retinopathy, inherited and age-related pathologies, tumours, coular diseases, nerve injuries, and conditions resulting from the activity of serine proceases. The present sequence represents a PCR primer used to isolate human PEDF genomic clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; retinal pigmented epithelium derived neurotrophic factor; PEDF; retinal disease; retinal tumour; retinoblastoma; retinal detachment; neuronal-retinal tumour; macular degeneration; retinitis pigmentosa; diabetic retinopathy; inherited and age-related pathology; tumour; ocular disease; nerve injury; serine protease related disorder; cytostatic; ophthalmological; antiinflammatory; antidiabetic; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating retinal disease such as retinal tumors, retinitis pigmentosa,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      involves

The present invention describes a method (M) for generating a substantially homogeneous population of undifferentiated cells (UC) from substantially homogeneous population of undifferentiated cells (UC) from a biological sample (BS), which comprises subjecting BS or its sub-sample to tissue-disruption to provide a mixed population (MP) comprising UC. corsequentially with SD, subjecting the cell population obtained to a cell size-discrimination step, Also described: (1) a cell-surface marker-discrimination step, Also described: (1) a cell-surface marker-discrimination step, Also described: (1) a comprising a population of undifferentiated cells (I) comprising a prowth factor identified using a homogeneous population of neural stem cells (NSCs) generated by (M); and (3) a composition (III) comprising a growth factor identified using a homogeneous population of neural stem cells (NSCs) generated by (M). (1) can have nootropic, neuroprotective and antiparkinsonian activities, and can be used in gene therapy. (M) is useful for generated by (M). (1) can have nootropic, neuroprotective and antiparkinsonian activities, and can be used in gene therapy. (M) is useful for the replacement of neural or non-neural tissue in an animal. (II) is useful in cell replacement therapy in an organ such as the brain or treating a CNS disorder such as Albitaimer's disease, treating a CNS disorder such as Albitaimer's disease, parkinson's disease, acute brain injury and CNS dysfunction. (I) is useful for the replacement such as Albitaimer's disease, parkinson of tissue. ABZ80278 to ABZ80363 represent for markers defining cell populations

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antisense compound 20-50 nucleobases in length targeted to a start codon region, coding region, a stop codon region or a 3'-untranslated region of a nucleic acid molecule encoding human Interleukin 12 p40 subunit. The compound specifically hybridises with one of the regions and inhibits the expression of human Interleukin 12 p40 subunit. The new compound is useful for inhibiting the expression of human Interleukin 12 p40 subunit in cells or tissues and comprises contacting the cells or tissues in vitro with the compound, so that expression of the human Interleukin 12 p40 subunit is inhibited. The antisense compound may also be used as research reagents and diagnostics, and as treatment or prevention of disease states, e.g. to prevent or

The invention relates to an oligonucleotide 8-50 nucleotides in length which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, regulating cell proliferation and has been implicated in lung carcinoma), and which is capable of inhibiting raf expression. Also included is a composition comprising the oligonucleotide and a pharmaceutically acceptable carrier. The antisense oligonucleotide is useful for inhibiting the expression of human raf in human cells or tissues, by contacting the human cells or tissues with the oligo. The oligo. is also is useful for treating or preventing a disease or condition associated with the expression of raf by administering it in combination with a chemotherapeutic agent to a human or cells of the human, where the chemotherapeutic agent to a human or cells of the human, where the chemotherapeutic agent to a human or cells of the human, where the chemotherapeutic agent to a human cannot an or cells of the numan, where the chemotherapeutic of raf is abnormal expression, and the condition is a human new angiogenesis or neovascularisation (preferrably ocular angiogenesis or neovascularisation). The oligo. is also useful for inhibiting
                                                                                                                                                                                                                                                                                                      ö
delay infection, inflammation or tumour formation, in animals and humans. The present sequence is an antisense oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antisense oligonucleotide which is targeted to mRNA encoding human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense; c-raf; a-raf; b-raf; protein kinase; cancer; ss; signal transduction; cell proliferation; lung carcinoma; cytostatic; antisense gene therapy; chemotherapeutic agent; angiogenesis; hyperproliferative condition; neovascularisation; ocular angiogenesis.

hyperproliferation of cells. The oligos. are also useful as tools, for example for detecting and determining the role of raf expression in various cell functions and physiological processes and conditions and for diagnosing conditions associated with raf expression and for research purposes. The present sequence is an antisense oligonucleotide included in the sequence listing but not mentioned elsewhere in the specification

The invention describes a method of diagnosing a cellular proliferative disorder of breast tissue in a subject comprising determining the state of methylation of one or more nucleic acid isolated from the subject, where the state of methylation of one or more nucleic acids is compared with the state of methylation of one or more nucleic acids from a subject of the state of methylation of one or more nucleic acids from a subject of the amount of the state of methylation of one or more nucleic acids from a subject of the activities of the methylation state of cyclin 14-3-3 sigma Opd islands in commal mammary epithelium, breast cancer cell lines and in primary
predisposition; reverse transcriptase PCR; RT-PCR; primer; CpG island; ss; cyclin 14-3-3 sigma; human.
                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing a cellular proliferative disorder of breast tissue in subject comprises determining the state of methylation of one or nucleic acid isolated from the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20 BP; 3 A; 9 C; 3 G; 5 T; 0 U; 0 Other;

(first entry)

29-JUL-2004

RESULT 1577 ABD29596/c

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating comprising oligonuclectides, effective for alleviating by the proposition of proposecretion, when administered to a mammal. The reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The reduce the amount of target polypeptide present in the lungs. The culmonary obstruction, and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, and/or surfactant hypoproduction and sortion of inflammation, allergies and/or surfactant hypoproduction and sortion of distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system of eg., lung, brain, heart, kidney, etc, tissue environment and thereby, to respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer. beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and Pabalan J, Aguilar D; Sequence 20 BP; 6 A; 4 C; 4 G; 6 T; 0 U; 0 Other; Claim 15; SEQ ID NO 12873; 763pp; English. The invention relates to a compound targeted to a nucleic acid molecule encoding a beta-site amyloid precursor protein (APP) -cleaving enzyme. The antisense oligonucleotides and compounds are useful for inhibiting the expression of beta-site amyloid precursor protein (APP) -cleaving enzyme, modulating amyloid deposition in neurons, altering the expression of a splice variant of beta-site APP-cleaving enzyme, and for treating diseases or conditions associated with expression of beta-site APP-cleaving enzyme e.g. neurodegeneration or Alzhaimer's disease. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylaxis applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; human; beta-site amyloid precursor protein; APP-cleaving enzyme; amyloid deposition; neurodegeneration; Alzheimer's disease; infection; inflammation; tumour; antisense.
                                           ss; human; beta-site amyloid precursor protein; APP-cleaving enzyme; amyloid deposition; neurodegeneration; Alzheimer's disease; infection; inflammation; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound targeted to a nucleic acid molecule encoding a beta-site amyloid precursor protein (APP)-cleaving enzyme, useful for treating diseases associated with beta-site APP-cleaving enzyme, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human APP-cleaving enzyme antisense oligonucleotide ISIS 223841.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.8%; Score 13.8; DB 1; Length 20; 88.2%; Pred. No. 1e+03;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            represents a human APP-cleaving enzyme target region.

The invention relates to a compound targeted to a nucleic acid molecule encoding a beta-site amyloid precursor protein (APP)-cleaving enzyme. The antisense oligonucleotides and compounds are useful for inhibiting the expression of beta-site amyloid precursor protein (APP)-cleaving enzyme, modulating amyloid deposition in neurons, altering the expression of a splice variant of beta-site APP-cleaving enzyme, and for treating classes or conditions associated with expression of beta-site APP-cleaving enzyme e.g. neurodegeneration or Alzheimer's disease. The artisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylaxis applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human APP-cleaving enzyme antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0;

The present invention describes a method for detecting a conserved structure in an RNA sequence. The method comprises: (a) placing 2 structures from structures generated for 2 RNA sequences from 2 organisms into a parent group; (b) generating an offspring group from the parent group; (c) determining fitness of the parent and offspring groups; (d) comparing the fitness of the parent and offspring groups; and (e) selecting at least one group from the parent and offspring groups; and the highest fitness, where the conserved structure in the RNA is present the highest faces, where the conserved structure in the RNA is present conserved structure in a RNA sequence. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                          o;

The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding sterol regulatory element-binding protein-1 (SREBP-1, also known eas sterol regulatory element-binding protein-1 (SREBP-1, also known control regulatory element-binding protein-1 (SREBP-1, and control regulatory element-binding control control control control east an 8-nucleobase in length that specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding sterol regulatory element-binding protein-1, a composition comprising the compound and a carrier or diluent, or neells or tissues (by contacting the colls or tissues with the compound in cells or tissues (by contacting the cells or tissues with the compound contact with sterol regulatory element-binding protein-1 contacting the colls or tissues with the compound contacting an animal having a disease or condition companies of sterol regulatory element-binding protein-1 compound so that expression of sterol regulatory element-binding protein-1 compound so that expression of sterol regulatory element-binding protein-1 compound so that expression of sterol regulatory element-binding protein-1 compound so that expression of sterol regulatory element-binding protein-1 is almibited. The animal a therapeutic or prophylactic amount of the compound so that expression of sterol regulatory element-binding protein-1 is modified internucleoside linkage (preferably a phosphorothicate linkage), enter least one modified mucleobase (preferably 5'-O-methoxyethyl sugar modety) and modified mucleobase (preferably 5'-O-methoxyethyl for modified modified mucleobase (preferably 5'-O-methoxyethyl for an encodified modified mucleobase (preferably 5'-O-methoxyethyl for an encodified modified mucleobase (preferably 5'-O-methoxyethyl for an encodified modified mucleobase (preferably 5'-O-methoxyethyl sugar modified mucleobase (preferably 5'-O-methoxyethyl sugar modified mucleobase (preferab
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -binding protein-1, such as a metabolic disorder e.g. diabetes, or a cardiovascular disorder, e.g. atherosclerosis or hyperlipidaemia. They are also useful in research and diagnostics for modulating the expression of sterol regulatory element-binding protein-1. The present sequence is an antisense oligonucleotide targeting mouse SREBP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  methylcytosine). The compound, composition and methods are useful for treating a disease or condition associated with sterol regulatory element
                   nucleic acid encoding sterol regulatory element-binding protein-1, useful for treating diabetes, atherosclerosis or hyperlipidemia.

The invention relates to a compound 8-80 mucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding sterol regulatory element-binding protein-1 (SRBB-1, also known as sterol regulatory element-binding protein-1 (SRBB-1, also known as sterol regulatory element-binding pranscription factor, SRBBF), and inhibits the expression of SRBP-1, i.e. is an antisense oligonuclectide. Also included are a compound 8-80 mucleobase in length that specifically comparing are are a compound 8-80 mucleobase portion of an active site on a nucleic acid molecule encoding sterol regulatory element-binding protein-1 in composition comprising the compound and a carrier or diluent, inhibiting the expression of sterol regulatory element-binding protein-1 in compound so trissues (by contacting the cells or tissues with the compound computed and treating an animal having a disease or condition associated with sterol regulatory element-binding protein-1 by associated with sterol regulatory element-binding protein-1 is inhibited. The antisense oligonuclectide comprises at least one conditied sucar moiety (preferably 2'-0-methoxyethyl sugar moiety) or at least one modified sucar moiety (preferably 2'-0-methoxyethyl sugar moiety) or at least one modified nucleobase (preferably 5-methoxyethyl sugar moiety) or at least one modified nucleobase (preferably 5-methoxyethyl sugar creating a disease or condition associated with sterol regulatory element-binding protein-1, such as a metabolic disorder e.g. diabetes, or are also useful in research and diagnostics for modulating the expression of sterol regulatory element-binding protein-1. The present sequence is a mean are also useful for the antisense oligonucleotides.
                                                                                                 New compounds, particularly antisense oligonuclectides targeted to a nucleic acid encoding sterol regulatory element-binding protein-1, useful for treating diabetes, atherosclerosis or hyperlipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 3 A; 9 C; 3 G; 5 T; 0 U; 0 Other;

The invention relates to a compound 8-80 nucleobases in length targeted co, and which specifically hybridises with a nucleic acid molecule conciding sterol regulatory element-binding protein-1 (SRBP-1, also known as sterol regulatory element-binding protein-1 (SRBP-1, also known in the capture are a compound 8-80 nucleobases in length that specifically hybridises with at least an 8-nucleobase sin length that specifically hybridises with a least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding sterol regulatory element-binding protein-1 inhibiting the expression of sterol regulatory element-binding protein-1 inhibiting the expression of sterol regulatory element-binding protein-1 in cells or tissues (by contacting the cempound and acarrier or diluent, inhibited) and treating an animal having a disease or condition associated with sterol regulatory element-binding protein-1 is inhibited and treating a natural having a disease or condition compound so that expression of sterol regulatory element-binding protein-1 is inhibited. The antisense oligonucleotide comprises at least one modified sugar moiety (preferably 2, -0-methoxyethyl sugar moiety) or at least one modified sugar moiety (preferably 2, -0-methoxyethyl sugar moiety) or at least one modified sugar moiety (preferably 2, -0-methoxyethyl sugar moiety) or at least one modified sugar moiety (preferably 2, -0-methoxyethyl sugar moiety) or at least one modified sugar moiety (preferably 2, -0-methoxyethyl sugar cardiovascular disorder, e.g. atherosclarosis or hyperlipidaemia. They are also useful in research and diagnostics for modulating the expression of sterol regulatory element-binding protein-1. The present sequence is an antisense oligonucleotide targeting human SREBP-1.

New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding sterol regulatory element-binding protein-1, useful for treating diabetes, atherosclerosis or hyperlipidemia.

Example 16; SEQ ID NO 181; 112pp; English

The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule concoling sterool regulatory element-binding protein-1 (SREBP-1, also known as sterool regulatory element-binding transcription factor, SREBP), and inhibits the expression of SREBP-1, i.e. is an antisense oligonucleotide. Also included are a compound 8-80 nucleobases in length that specifically conversely with at least an 8-nucleobases in length that specifically succession of sterol regulatory element-binding protein-1, a composition comprising the compound and a carrier or diluent, in cells or tissues (by contacting the cells or tissues with the compound of sterol regulatory element-binding protein-1 in cells or tissues (by contacting the cells or tissues with the compound of sterol regulatory element-binding protein-1 is associated with sterol regulatory element-binding protein-1 by associated with sterol regulatory element-binding protein-1 is associated with sterol regulatory (preferably a phosphorothicate linkage), at least one modified supar moiety (preferably 2'-O-methoxyethyl sugar moiety) or at least one modified supar moiety (preferably 2'-O-methoxyethyl sugar moiety) or at least one modified nucleobase (preferably 5-moiety) creating a disease or condition associated with sterol regulatory element compound, composition and methods are useful for treating a disease or condition associated with sterol regulatory element condition associated with sterol regulatory element of attached are also useful in research and diagnostics for modulating the expression of sterol regulatory element ending a prisearch and insease oligonucleotice is a human SRBP-1 target region for the arrisense oligonucleotice is a longer region for the arrisense oligoner is a present sequence is a human SREBP-1 target region for the antisense oligonucleotides

inhibited and treating an animal having a disease or condition associated and treating an animal having a disease or condition associated with sterol regulatory element-binding protein-1 by administering to the animal a therapeutic or prophylactic amount of the compound so that expression of sterol regulatory element-binding protein-1 is inhibited. The antisense oligonucleotide comprises at least one modified internucleoside linkage (preferably a phosphorotothioare linkage), an least one modified sugar moiety (preferably 2.0-methoxyethyl sugar moiety) or at least one modified nucleobase (preferably 5-methoxyethyl sugar methylcytosine). The compound, composition and methods are useful for

```
The invention relates to a compound 8-80 nucleobases in length targeted cto, and which specifically hybridises with a nucleic acid molecule cto, and which specifically hybridises with a nucleic acid molecule encoding sterol regulatory element-binding transcription factor, SREBF), and as sterol regulatory element-binding transcription factor, SREBF), and cto included are a compound 8-80 nucleobases in length that specifically hybridises with at least an 8-nucleobases in length that specifically cucleic acid molecule encoding sterol regulatory element-binding protein-ctor inhibiting the expression of sterol regulatory element-binding protein-ctor includes of sterol regulatory element-binding protein-ctor includes of sterol regulatory element-binding protein-ctor included and treating an animal having a disease or condition associated with sterol regulatory element-binding protein-lise associated with sterol regulatory element-binding protein-lise compound so that expression of sterol regulatory element-binding protein-lise administering to the animal a therapeutic or prophylactic amount of the compound so that expression of sterol regulatory element-binding protein-compound so that expression element-binding protein-compound 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding sterol regulatory element-binding protein-1, useful for treating diabetes, atherosclerosis or hyperlipidemia.
                                                                                                                                                                                                                                                                                                           ö
-binding protein-1, such as a metabolic disorder e.g. diabetes, or a cardiovascular disorder, e.g. atherosclerosis or hyperlipidaemia. They are also useful in research and diagnostics for modulating the expression of sterol regulatory element-binding protein-1. The present sequence is an antisense oligonucleotide targeting mouse SREBP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sterol regulatory element-binding transcription factor; SREBF; metabolic disorder; diabetes; cardiovascular disorder; atherosclerosis;

            at least one modified sugar mojety (preferably 2-0-methoxyethyl sugar moiety) or at least one modified nucleobase (preferably 5-0-methoxyethyl sugar methylcytosine). The compound, composition and methods are useful for treating a disease or condition associated with sterol regulatory element binding protein-1, such as a metabolic disorder e.g. diabetes, or a cardiovascular disorder, e.g. atherosclerosis or hyperlipidemia. They are also useful in research and diagnostics for modulating the expression of sterol regulatory element-binding protein-1. The present sequence is a
                                                                                                                                                                                                                        ·,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
 modified internucleoside linkage (preferably a phosphorothioate linkage),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetees; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Human glucocorticoid receptor-specific antisense oligonucleotide #4116.
                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding
                                                                                                                                mouse SREBP-1 target region for the antisense oligonucleotides
                                                                                                                                                                                                                        ·

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises an antisense oligonucleotides that are targeted to mucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                             antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                  Human glucocorticoid receptor-specific antisense oligonucleotide #3762.

The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding Livin and that specifically hybridises with the nucleic acid encoding Livin and inhibits expression of Livin. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative disorder or aberrant apoptosis. The present sequence represents a human livin antisense oligonucleotide.
                                                                                                                                                                                                       The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding Livin and that specifically hybridises with the nucleic acid encoding Livin and inhibits expression of Livin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a compound targeted to and which specifically hybridises with a nucleic acid molecule encoding VBGF-C, and inhibits the expression of VBGF-C. The compound, composition and methods are useful for treating a disease or condition associated with VBGF-C, such as a cardiovascular disorder e.g. atherosclerosis or diabetic retinopathy or an autoimmune or inflammatory disorder. They are also useful in research and diagnostics for modulating the expression of VBGF-C. The present sequence represents a human VBGF-C antisense oligomucleotide.

The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutary1-Coenzyme A (EMG-CoA) reductase, and inhibits the expression of HMG-COA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds, compositions and methods are useful for treating a disease or condition associated with HMG-CoA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-CoA reductase. This polynucleotide sequence represents an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                           HMG-COA reductase; 3-hydroxy-3-methylglutaryl-Coenzyme A;
